UEBA – Implementation Architecture

How the in-house UEBA system is built: logs come in from five sources, a collector service turns them into per-user and per-device behaviour, three detectors score each day, and the results go to the SOC console, alerts and a local AI assistant.

Data moves top to bottom. The collector service is the only part that writes scores. The console, alerting and AI assistant read its results, and analyst verdicts feed back into the next scoring run.

Component	Runs as	Address
SOC console	`streamlit run dashboard/app.py`	localhost:8501
Collector service + ingest API	`python -m ueba.service --api`	127.0.0.1:8600/api/v1
Local language model	Ollama, `qwen2.5:7b`	localhost:11434
Everything at once	`python launch.py`	–
